Bilateral Meetings

- (14:00-17:00)

Description

Primary core expertise of Belit ranges from industry core C#, Java or php code, to enterprise applications, and extends to analytics, processing and management of large-scale structured or raw datasets. The diverse team of Belit experts and professionals covers all segments of research and development of information systems - conceptualization/ideation, system analysis, requirements and business process engineering, design, development, implementation, deployment, testing and piloting studies, auditing, organization and management, and all aspects of customer support. Participating in research and innovation projects funded by the EC since 2009 (CIP ICT-PSP, Horizon 2020), Belit is focused on UI/UX and applications development, big data analytics and decision support, and finally IoT sensing deployment, integration and management, particularly in pilot testbed deployment and support, such as on related SmartCare, MOEEBIUS and HOLISDER projects (project summaries provided further below). Particularly referent related experience has been the development, implementation and large-scale pilot deployment and validation of ICT services for integrated (health and social) care across silos in the SmartCare project, additionally connected with the existing PHC system and leveraging on EHR data subsets in the testbed town of Kraljevo, reference location of EIP on AHA. Likewise significant reference is the development of unified project-wide platform and framework analytics, dashboarding collaborative tools, data model and integration of the system for age-friendly cities/communities and public spaces in the recently completed City4Age project, as well as of the Public Health Observatory analytics, UI visualizations, urban well-being models, and data fusion and system integration on the ongoing PULSE project.
